## Introduction

- Atrial fibrillation (AF) is the leading cause of ischemic stroke and its importance as etiologic factor, increases with patient age<sup>1</sup>.
- Evidence-based clinical guidelines recommend anticoagulation treatment in patients with AF and associated embolism risk<sup>2</sup>.
- Vitamin K antagonists (warfarin) have showed high efficacy<sup>3,4</sup>, but they require a narrow INR monitoring and frequent doses adjustments to avoid stroke or bleeding associated risks.
- The RE-LY study was designed to demonstrate the safety and efficacy of dabigatran (150 and 110 mg bid) for stroke prevention in non-valvular AF patients<sup>5,6</sup>.

## Objective

Assessment of the cost-effectiveness of dabigatran for stroke and systemic embolism prevention in patients with non-valvular atrial fibrillation in Spain, under the National Health System perspective.

## Methods

### MODEL DESIGN:

- A sequential Markov model (Figure 1) which simulates the natural history of the disease in patients with non-valvular AF was adapted to the Spanish setting<sup>7</sup>.
- Sequential model where all patients enter into the model with dabigatran 150mg (BID) and once aged 80 years they change to dabigatran 110 mg (BID), according to the summary of product characteristics.
- Markov cycle duration was 3 months with half-cycle correction.
- Cost and outcomes were discounted at a 3% rate<sup>8</sup>.

### CLINICAL EVENTS:

- Patients could suffer any of the events described in Figure 1 or die.
- Patients who suffered an IS, HS or ICH could experience a change on the disability level.

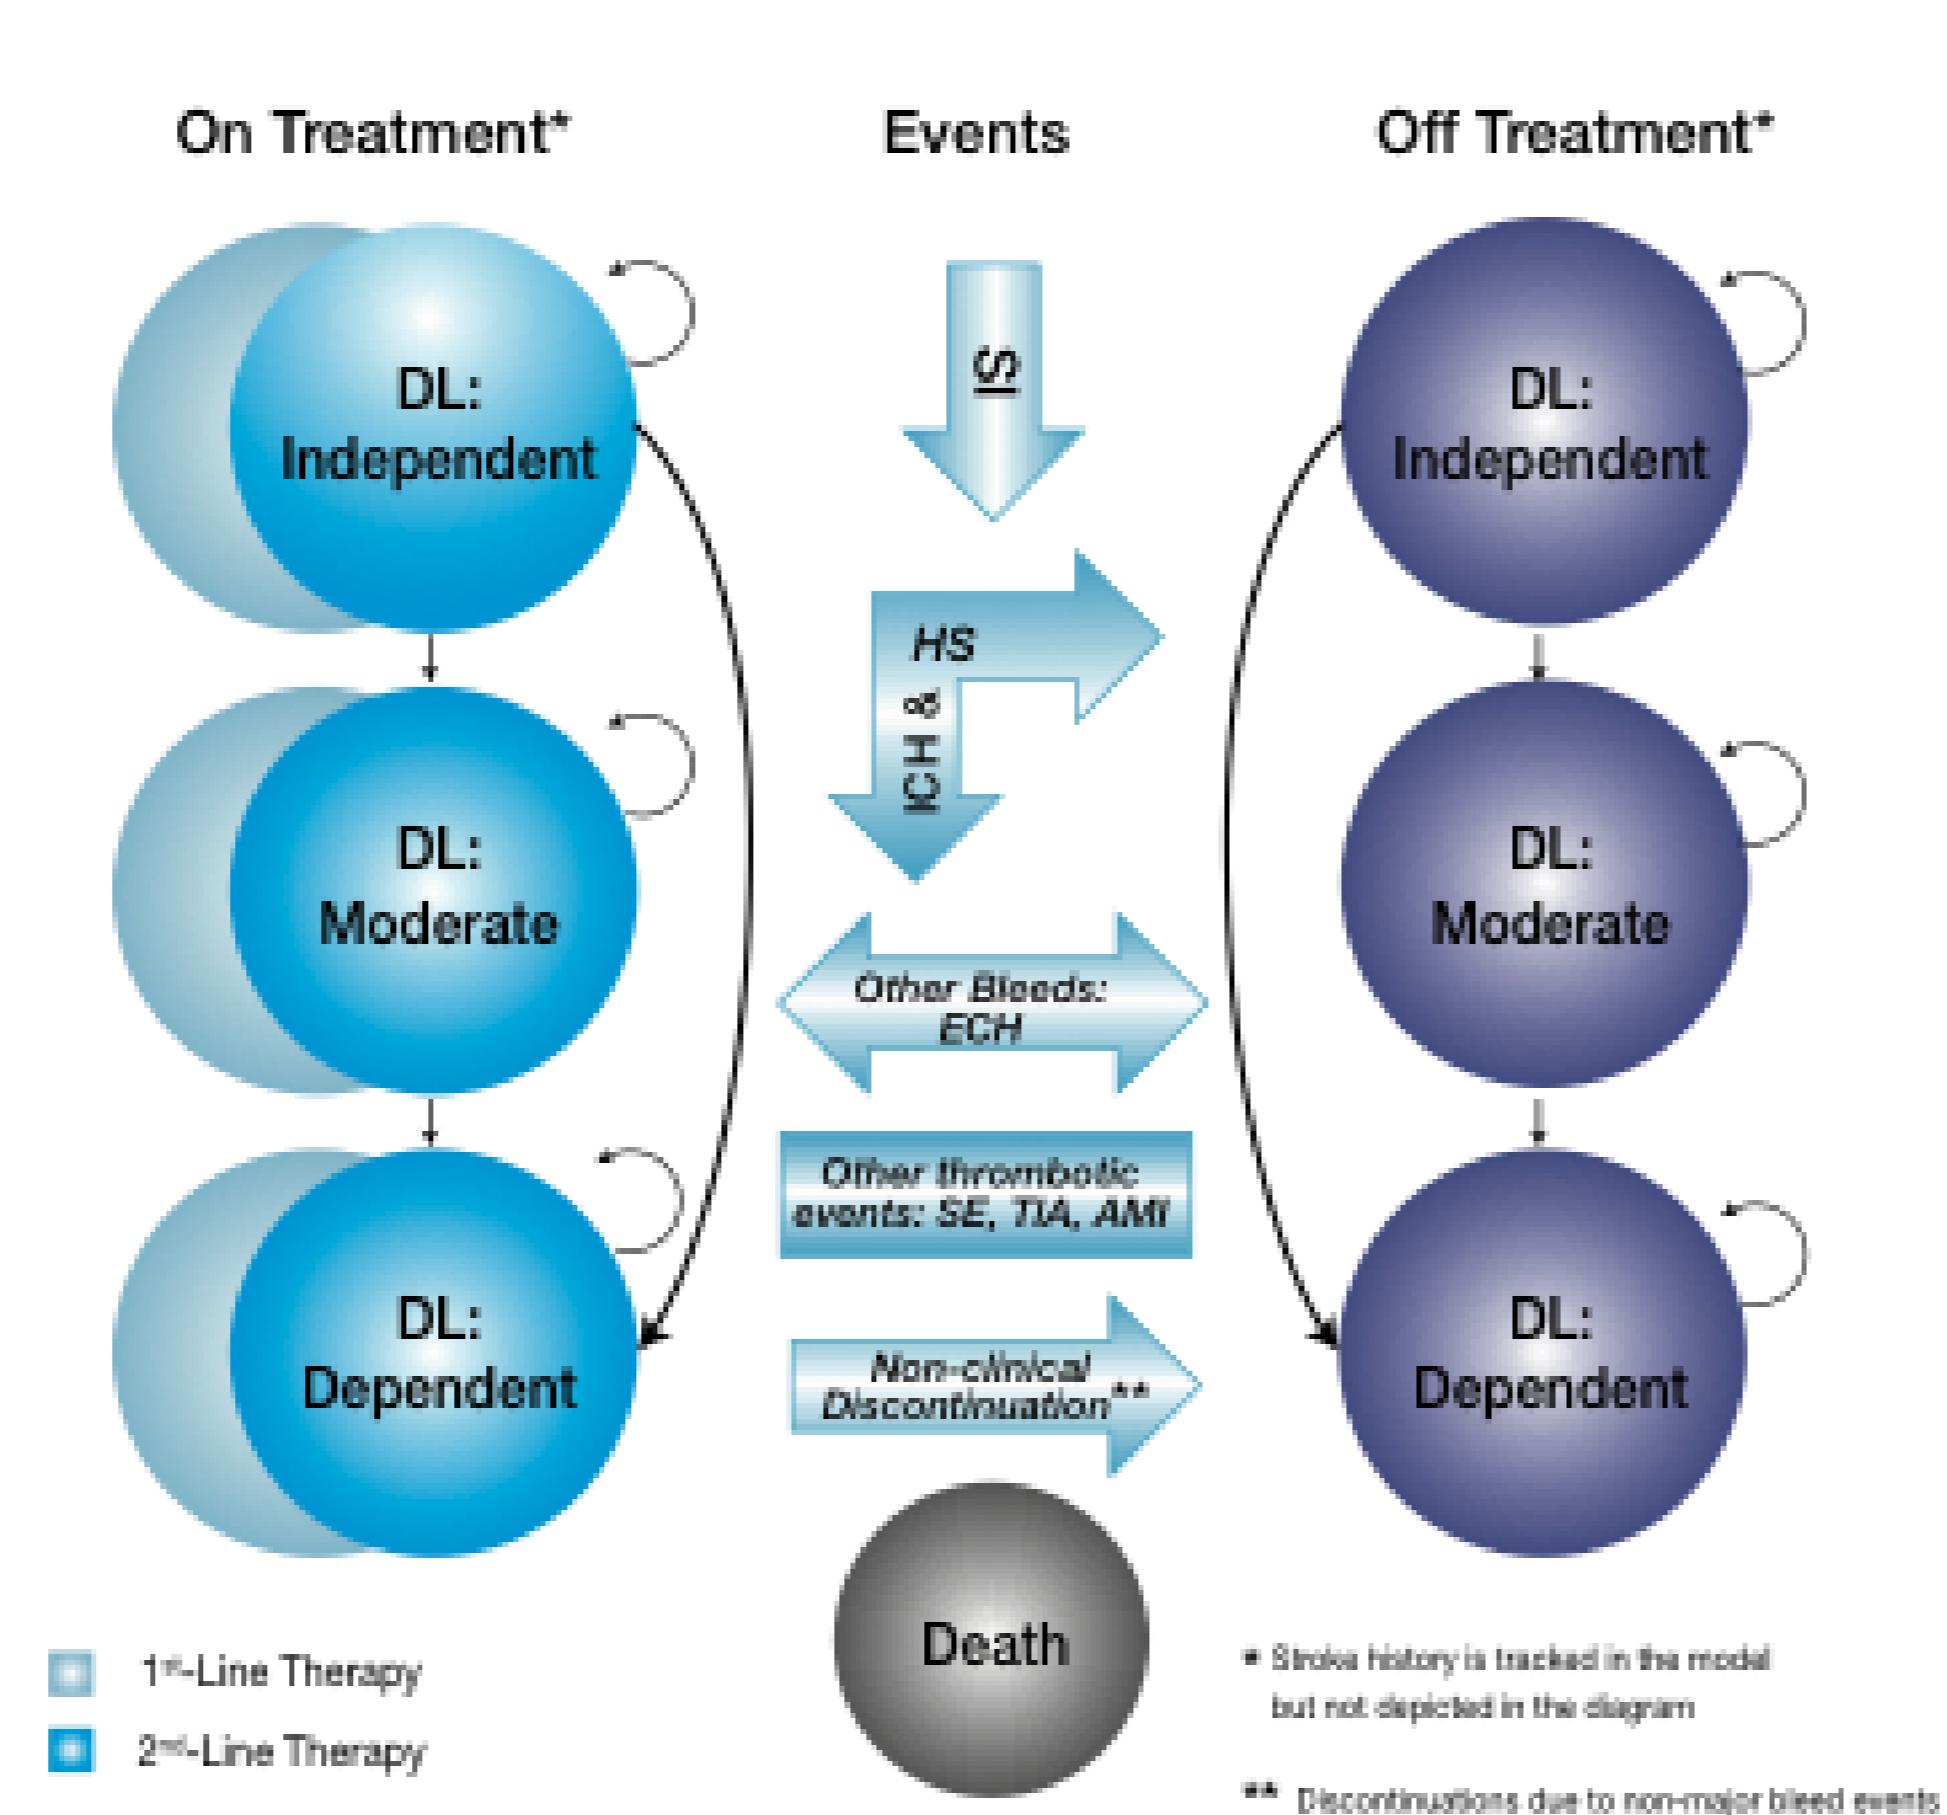

### COMPARATORS:

- First scenario: Warfarin.
- Second scenario: Real-world prescription pattern, 60% of patients treated with vitamin K antagonist, 30% with acetylsalicylic acid and 10% received no treatment.

### INPUTS

- A 10,000 patients cohort, totally independent and aged 69.1 years, following the RE-LY<sup>5,6</sup> patient profile (CHADS2 stroke risk and INR time in therapeutic range) was followed during a lifetime period.
- Clinical efficacy, disability and discontinuation rates and utility estimates were kept as in the original model<sup>7</sup>.
- Age-adjusted, all cause mortality was obtained from Spanish national statistics<sup>9</sup>.
- Costs (€, 2010) are detailed in Table 1.

Figure 1. Sequential Markov model diagram

AMI: Acute myocardial infarction.  
ECH: Extracranial hemorrhage.  
HS: Hemorrhagic stroke.  
ICH: Intracranial hemorrhage.

IS: Ischemic stroke.  
SE: Systemic embolism.  
TIA: Transient ischemic attack.

- Deterministic and probabilistic sensitivity analyses (SA) were performed.
  - One-way deterministic SA was carried out with several parameters. Additionally the model was run, considering the societal perspective. Thus direct non-health care costs<sup>10,11</sup> were included. (Table 2)
  - A MonteCarlo SA (10,000 simulations) was also performed.

Table 1. Unit cost (€, 2010)

DRUG	DAILY COST, Public cost + VAT (including RD 8/2010, 7,5% deduction)	DRUG	DAILY COST, Public cost + VAT (with RD 8/2010, 7,5% deduction)
Dabigatran 150mg (twice daily)	3.03 12	Warfarin 2.1 mg	0.05 12
Dabigatran 110mg (twice daily)	3.03 12	Acetylsalicylic acid [average with 100 mg (70%) and 300 mg (30%)]	0.10 12
EVENT	COST	EVENT	COST
Fatal IS	4,237,76 13	Fatal ICH	5,830,96 13
IS, Independent	4,407,58 13,14	ICH, independent	6,000,78 13,14
IS moderate disability	4,827,18 13,14	ICH, moderate disability	6,250,56 13,14
IS totally dependent	5,483,06 13,14	ICH, totally dependent	6,496,84 13,14
Fatal SE	1,834,94 13	Fatal ECH	3,724,68 13
Non-fatal SE	1,834,94 13	Non-fatal ECH, no gastrointestinal	2,581,82 13
TIA	2,453,36 13	Non-fatal ECH, gastrointestinal	2,581,82 13
Fatal HS	5,930,96 13	Minor bleeding	188,96 15
HS, Independent	6,000,78 13,14	Fatal AMI	4,072,94 13
HS, moderate disability	6,250,56 13,14	Non-fatal AMI	4,072,94 13
HS, totally dependent	6,496,84 13,14		
ASSOCIATED DISABILITY LEVEL	COST PER 3 FOLLOW-UP MONTHS	INR MONITORING	YEARLY COST
Post-stroke, independent	169,82 14	Well controlled patients	382,83 16,17
Post-stroke, moderate disability	419,60 14	Poor controlled patients	472,70 16,17
Post-stroke, totally dependent	655,98 14		

\* assuming silent form for 11%

Table 2: Incremental costs by disability level used for SA with societal perspective (€, 2010)

	Independent	Moderate disability	Totally dependent
Drug costs			
For each IS, HS and ICH			
Investment (house renovation) <sup>11</sup>	0,0	31,1	31,1
Public institutionalization <sup>11</sup>	0,0	125,8	125,8
For each 3 follow-up months period in post-stroke patients			
Private institutionalization <sup>11</sup>	0,0	76,9	76,9
Day-care centers <sup>11</sup>	0,0	426,6	426,6
Informal care (cost per hour = € 10,6) <sup>10</sup>	5,970,1	9,596,6	11,958,9

## Results

- Dabigatran reduced the occurrence of clinical events in both scenarios, providing gains in quantity and quality of life. (Table 3)
- The incremental cost-effectiveness ratio (ICER) for dabigatran compared to warfarin was € 17,581/QALY gained and € 14,118/QALY gained when compared to the real world prescription pattern. (Table 3).

Table 3. Cost-effectiveness analysis results

Per patient (lifetime)	Drug cost (€, 2010)	Event cost (€, 2010)	Follow-up costs (€, 2010)	Total cost (€, 2010)	LYG	QALYs	Incremental costs	Incremental QALYs	ICER (€ / QALY)
<b>SCENARIO 1 (dabigatran vs warfarin RE-LY)</b>									
Warfarin	3,475	3,678	3,190	10,343	11,13	8,45	4,851	0,28	17,581
Dabigatran	8,857	3,409	2,927	15,193	11,39	8,73			
<b>SCENARIO 2 (dabigatran vs real world prescription pattern)</b>									
Prescription pattern	2,178	3,889	3,358	9,426	11,02	8,32	5,789	0,34	14,118
Dabigatran	8,857	3,409	2,927	15,193	11,39	8,73			

LYG: Life year gained. QALY: Quality Adjusted Life Year. ICER: Incremental cost-effectiveness ratio

- The model proved to be robust according to the SA performed. (Table 4)
- Probabilistic SA results show that for a € 30,000/QALY threshold<sup>18</sup>, probability of being cost-effective is 96.4% and 99.9% in first and second scenario.
- When the social costs were included in the analysis, dabigatran resulted in a dominant strategy (i.e. more effective and less costly).

Table 4. Deterministic SA results

Parameter	BC Value	SA value	ICER (€/QALY)	Variation (%) vs BC	ICER (€/QALY)	Variation (%) vs BC
BASE CASE (BC) RESULTS			17,581		14,118

Perspective	National Health System perspective	Societal perspective with non-health direct cost (table 3)	Dominant		Dominant	

## Conclusions

- From the Spanish National Health System perspective, dabigatran is an efficient strategy for the prevention of stroke in patients with non-valvular atrial fibrillation compared to warfarin and to the real-world prescription pattern. ICERs were below the € 30,000/QALY threshold in both scenarios.
- From the societal perspective, dabigatran shows to be a dominant strategy, providing higher effectiveness and lower costs compared to both alternatives.
