Background

GeoHealthS

Population
health index

Policy
making

**Life expectancy
at birth
(WHO/Europe,
2007)**

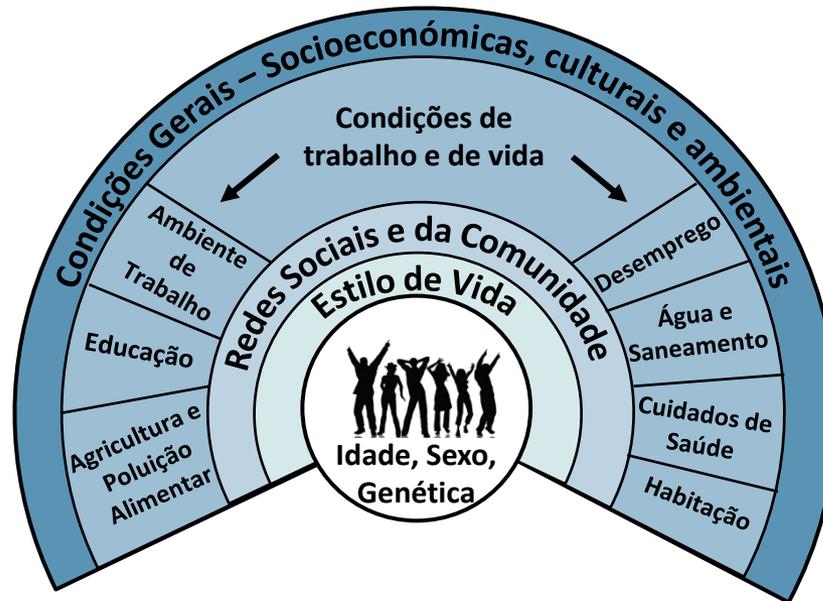

In spite of the gains in health observed in the last years in Europe, there are persisting health disparities between countries and within countries

**In order to be able to reduce health disparities,
actions targeted to their causes are required**

Which are the factors influencing the health status of the population?

Social Determinants of Health

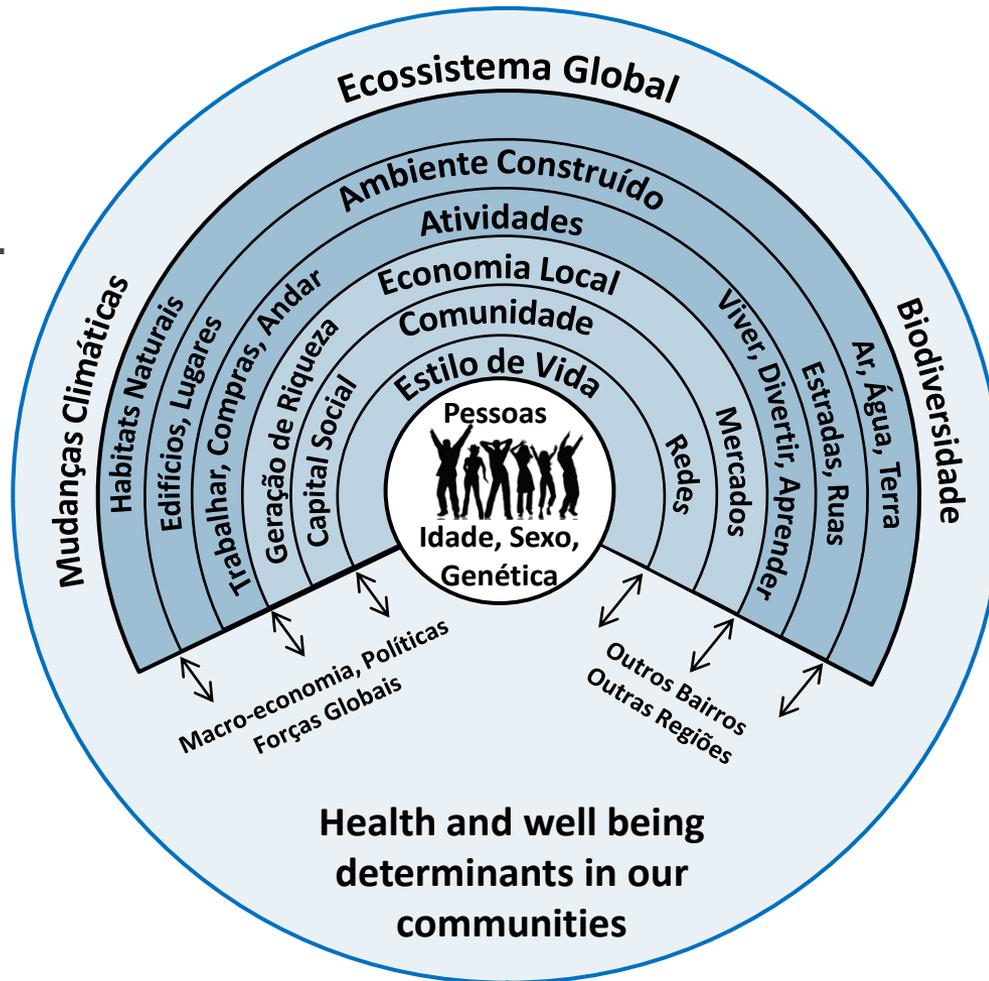

The influence of the “place” in individual and collective health...

How to support policy makers in the selection of interventions that generate gains in the health of the population?

What is the relevance of the evaluation of health status?

With which instruments?

Policy
making

Objectives

Evaluation of the health status of the Portuguese population over the last 20 years and building of scenarios through the development of a Population Health Index - PIH

- To ascertain spatial disparities in the health status of the population
- To identify the explaining factors of health disparities in Portugal
- To assess the trend of the evolution of the health status of the population over the last 20 years
- To identify policies promoting change and improvements in the current health status of the population

GeoHealthS: Research plan

1. To identify factors influencing the health status of the Portuguese population
2. To weight each factor according to its power to reflect and explain the health status of the population
3. Geostatistical analysis
4. To build value functions
5. To apply the PHI to Portuguese municipalities in 1991, 2001 and 2011
6. To design strategies to support decision making and policy
7. GeoHealthS WebSIG
8. Dissemination of results

GeoHealthS: Methods

- Delphi panel
- Nominal group technique
- Multicriteria decision analysis
- Spatial statistics
(geostatistics)

Qualitative methods

Quantitative methods

GeoHealthS

Population
health index

Policy
making

Population Health Index - PIH

- It is an instrument to assess in an integrated and holistic manner the collective health status of the population and can be applied to different spatio-temporal scales
- Consistent and comprehensive measure of the health of the populations
- It is composed by indicators or proxies expressing health results (mortality or morbidity) and indicators of social determinants of health
 - Demographic
 - Lifestyles
 - Built and physical environment as well as economic and social
 - Supply, access and use of health care services

Population Health Index

$$V(i) = \sum [s(ji) \cdot w(j)]$$

PHI

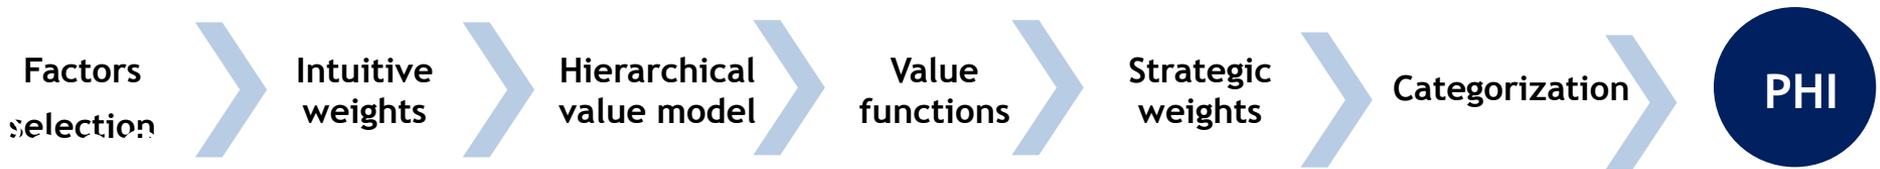

Where:

$V(i)$ = general “value” (model total *score*) of the municipality

$s(ji)$ = Value function of criterium j in municipality i

$w(j)$ = Strategic weight of criterium j

Population
health index

Policy
making

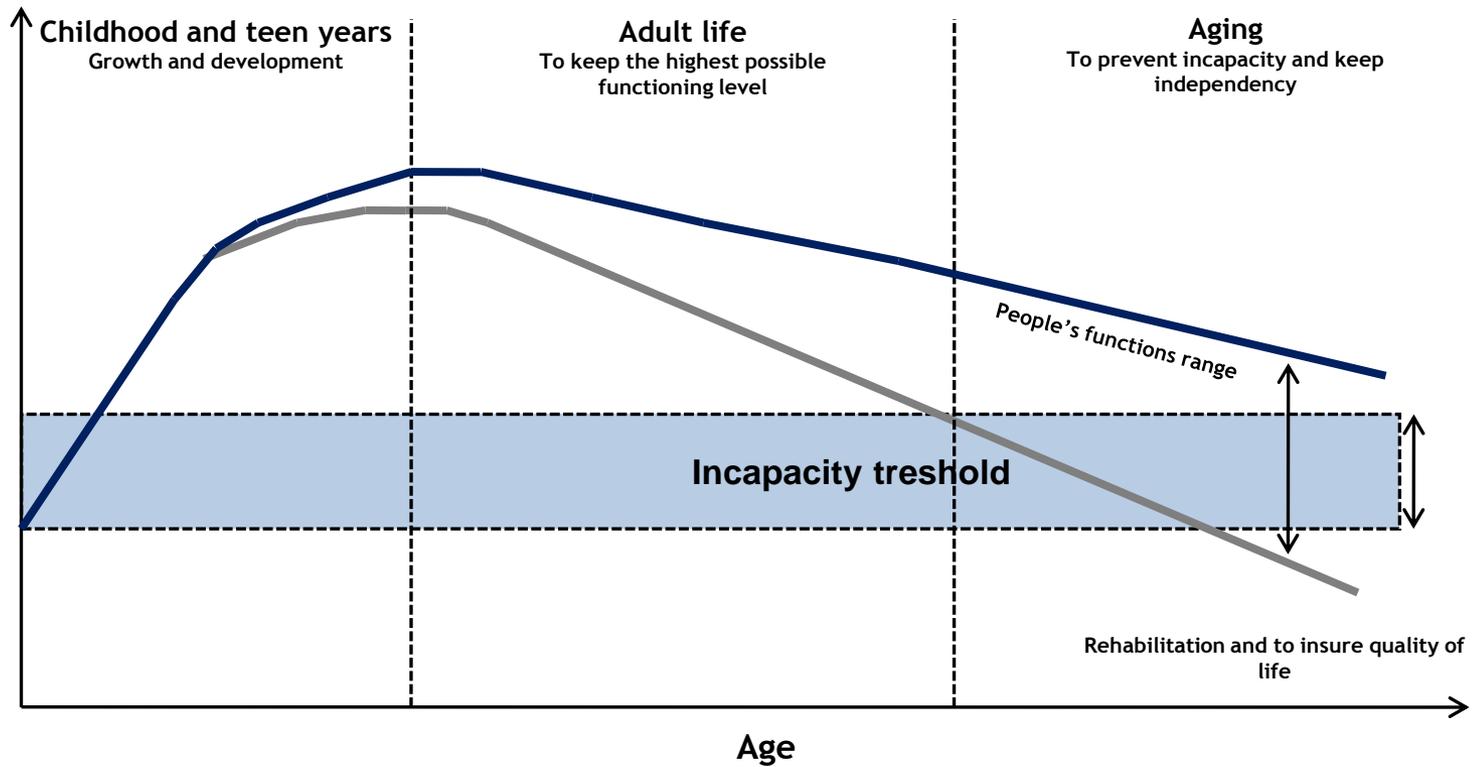

In which way can the PHI support the selection of measures and policies aiming at increasing the health gains of the population at local and national levels?
